                <h3>

                    According to the World Health Organization (WHO), cardiovascular diseases (CVDs) are the number one
```

cause of death

today. Over 17.7 million people died from CVDs in the year2017 all

over the world which is about

31% of all deaths, and

over 75% of these deaths occur in low and middle-incomecountries.

Arrhythmia is a representative

type of CVD that refers to any irregular change from the normal heart rhythms.

There are several types of arrhythmia

including atrial

fibrillation, premature contraction, ventricular fibrillation,and

tachycardia. Although a single

arrhythmia heartbeat

may not have a serious impact on life, continuous arrhythmiabeats can

result in fatal

circumstances.

            We are a team of
            <span style="color: #e0501b; font-size: 4vw">Arrthymia Prediction</span>
        </h1>
        <h3 style="font-family:Lucida Calligraphy;">
            In this project, we build an effective electrocardiogram (ECG) arrhythmia classification method
            using a convolutional
            neural network (CNN), in which we classify ECG into seven categories, one being normal and
the other
            six being different
            types of arrhythmia using deep two-dimensional CNN with grayscale ECG images. We are
creating a web
            application where
            the user selects the image which is to be classified. The image is fed into the model that is
            trained and the cited
            class will be displayed on the webpage.
        </h3>
